

Dear Editor-in-Chief,

We wish to submit our manuscript entitled “A Season-Structured Validation and Governance Architecture for Autonomous Strategy-Proposal Generation in Algorithmic Trading” for consideration for publication in MDPI Analytics.

The paper presents a season-structured validation architecture for prescriptive analytics research. A locally deployed large language model proposes directional cryptocurrency trading strategies within experimental seasons, while a multi-layer validation system and a human reviewer at season boundaries constrain the search and update the objectives and acceptance gates. We believe the work is a good fit for Analytics because it combines predictive modeling, simulation-based optimization, and temporally-ordered feature validation into a single reproducible decision-support system, with a disciplined treatment of look-ahead bias, overfitting, and multiple testing in automated strategy research.

This manuscript is original, has not been published previously, and is not under consideration for publication elsewhere. All authors have approved the manuscript and agree with its submission to Analytics.

We thank you for your consideration.

Sincerely, Pedro Sobreiro (on behalf of all co-authors)
